

1. Use modular arithmetic to determine the day of the week 1000 days after Friday, March 11, 2016.

$$1000 = (142)(7) + 6 \implies 1000 \equiv 6 \pmod{7}$$

It will be 6 days after Friday, which is Thursday.

2. Use modular arithmetic to determine the day of the week on March 11, 2036.

There are  $(36 - 16)(365) + 5 = 7305$  days between March 11, 2016 and March 11, 2036. We know  $7305 \equiv 4 \pmod{7}$ , so it will be 4 days after Friday, which is Tuesday.

3. Can modular arithmetic be used to help us determine what month it is exactly 5000 days after Friday, March 11, 2016? If so, what month is it? Otherwise, explain why modular arithmetic provides no help in solving this problem.

4. Without using a calculator,

find the remainder when  $8^{10}$  is divided by 11 and when  $5^9$  is divided by 13.

$10 = 5 \cdot 2$	$5^9 = 5^3 \cdot 5^6$
$8^{10} = 8^{5 \cdot 2}$	$5^9 \equiv 125 \cdot 5^6 \pmod{13}$
$64^5 \equiv 2^5 \pmod{11}$	$\equiv -8 \cdot 5^6 \pmod{13}$
$\equiv 32 \pmod{11}$	$\equiv 5 \cdot 5^6 \pmod{13}$
$\equiv 1 \pmod{11}$	$\equiv 5 \cdot 125 \cdot 125 \pmod{13}$
	$\equiv 125 \pmod{13}$
	$\equiv 5 \pmod{13}$

The remainder is 1.

The remainder is 5.

5. If  $a \in \mathbb{Z}$ , prove that  $a^3 \not\equiv 2 \pmod{4}$ .

Since  $a \in \mathbb{Z}$ , we have that  $a \equiv 0 \pmod{4}$ ,  $a \equiv 1 \pmod{4}$ ,  $a \equiv 2 \pmod{4}$ , or  $a \equiv 3 \pmod{4}$ . If  $a \equiv 0 \pmod{4}$ , then  $a^3 \equiv 0^3 \pmod{4}$ , which is equivalent to  $0 \pmod{4}$ . If  $a \equiv 1 \pmod{4}$ , then  $a^3 \equiv 1^3 \pmod{4}$ , which is equivalent to  $1 \pmod{4}$ . If  $a \equiv 2 \pmod{4}$ , then  $a^3 \equiv 2^3 \pmod{4}$ , which is equivalent to  $8 \pmod{4}$ , or  $0 \pmod{4}$ . If  $a \equiv 3 \pmod{4}$ , then  $a^3 \equiv 3^3 \pmod{4}$ , which is equivalent to  $27 \pmod{4}$ , or  $3 \pmod{4}$ . Therefore, it is impossible that  $a^3 \equiv 2 \pmod{4}$ .

6. Suppose that  $m, n \in \mathbb{Z}$ , with  $m, n \geq 2$  and write  $l = \text{lcm}(m, n)$ .

- (a) If  $a$  and  $b$  are integers such that  $a \equiv b \pmod{l}$ , prove that  $a \equiv b \pmod{m}$  and  $a \equiv b \pmod{n}$ .

Suppose  $a \equiv b \pmod{l}$ . Then  $l \mid (a - b)$ , or  $a - b = lj$ ,  $j \in \mathbb{Z}$ . Since  $l = \text{lcm}(m, n)$ , we know that both the prime factorization of  $m$  and  $n$  appear in the prime factorization of  $l$ . Suppose, without loss of generality, that we factor out the prime factorization of  $m = p_1^{\alpha_1} p_2^{\alpha_2} \dots p_k^{\alpha_k}$ ,  $k \in \mathbb{Z}$  out of the prime factorization of  $l = p_1^{\gamma_1} p_2^{\gamma_2} \dots p_q^{\gamma_q}$ ,  $q \in \mathbb{Z}$ . Then we are left with  $l = m \cdot \frac{l}{m}$ , where  $\frac{l}{m} \in \mathbb{Z}$ . Then we have  $a - b = m \cdot \frac{l}{m} \cdot j$ , which is  $m$  times an integer  $r$ . Therefore  $a - b = mr$ , so  $m \mid (a - b)$ , and  $a \equiv b \pmod{m}$ .

△

- (b) If  $a$  and  $b$  are integers such that  $a \equiv b \pmod{m}$  and  $a \equiv b \pmod{n}$ , can we conclude that  $a \equiv b \pmod{l}$ ? Either prove your answer or provide a counterexample.

7. If  $a, b, n \in \mathbb{Z}$ , we adopt the notation that

$$a + n\mathbb{Z} = \{a + nz : z \in \mathbb{Z}\}.$$

If  $(a + n\mathbb{Z}) \cap (b + n\mathbb{Z}) \neq \emptyset$ , prove that  $a + n\mathbb{Z} = b + n\mathbb{Z}$ .
